

Question 1 :

```
import 'dart:io';
```

```
void main() {
```

```
    double celsius = double.parse(stdin.readLineSync());
```

```
    double fahrenheit = celsius * 9 / 5 + 32;
```

```
    print('$celsius Celsius = $fahrenheit Fahrenheit');
```

```
}
```

Question 2 :

```
void main() {
```

```
    int score = 85;
```

```
    // Using if / else if
```

```
    if (score >= 90) {
```

```
        print('A');
```

```
    } else if (score >= 80) {
```

```
        print('B');
```

```
    } else if (score >= 70) {
```

```
        print('C');
```

```
    } else if (score >= 60) {
```

```
        print('D');
```

```
    } else {
```

```
        print('F');
```

```
}
```

```
// Using switch
switch (score ~/ 10) {
case 10:
case 9:
print('A');
break;

case 8:
print('B');
break;

case 7:
print('C');
break;

case 6:
print('D');
break;

default:
print('F');
}
}
```

Question 3 :

```
import 'dart:math';
```

```
int splitBill({
    required double total,
    required int people,
    double tipPercent = 10,
}) {
    double tip = total * tipPercent / 100;

    double totalBill = total + tip;

    double personBill = totalBill / people;

    return ceil(personBill).toInt();
}
```

```
void main() {
    double total = 100;
    int people = 4;
```

```
    int result = splitBill(
        total: total,
        people: people,
    );
```

```
    print('Each person pays: $result');
```

```
    int result2 = splitBill(
        total: total,
```

```
people: people,  
tipPercent: 15,  
);
```

```
print('With 15% tip: $result2');  
}
```
